## ANTICONVULSANT DERIVATIVES USEFUL IN REDUCING BLOOD GLUCOSE LEVELS

### BACKGROUND OF THE INVENTION

5

Compounds of Formula I:

are structurally novel antiepileptic compounds that are highly effective anticonvulsants  
10 in animal tests (Maryanoff, B.E, Nortey, S.O., Gardocki, J.F., Shank, R.P. and  
Dodgson, S.P. *J. Med. Chem.* 30, 880-887, 1987; Maryanoff, B.E., Costanzo, M.J.,  
Shank, R.P., Schupsky, J.J., Ortegon, M.E., and Vaught J.L. *Bioorganic & Medicinal  
Chemistry Letters* 3, 2653-2656, 1993). These compounds are covered by US Patent  
No.4,513,006. One of these compounds 2,3:4,5-bis-O-(1-methylethylidene)- $\beta$ -D-  
15 fructopyranose sulfamate known as topiramate has been demonstrated in clinical trials  
of human epilepsy to be effective as adjunctive therapy or as monotherapy in treating  
simple and complex partial seizures and secondarily generalized seizures (E. FAUGHT,  
B.J. WILDER, R.E. RAMSEY, R.A. REIFE, L D. KRAMER, G.W. PLEDGER, R.M.  
KARIM et. al., *Epilepsia* 36 (S4) 33, 1995; S.K. SACHDEO, R.C. SACHDEO, R.A.  
20 REIFE, P. LIM and G. PLEDGER, *Epilepsia* 36 (S4) 33, 1995), and is currently  
marketed for the treatment of simple and complex partial seizure epilepsy with or  
without secondary generalized seizures in approximately twenty countries including the  
United States, and applications for regulatory approval are presently pending in several  
additional countries throughout the world.

25 Compounds of Formula I were initially found to possess anticonvulsant activity  
in the traditional maximal electroshock seizure (MES) test in mice (SHANK, R.P.,  
GARDOCKI, J.F., VAUGHT, J.L., DAVIS, C.B., SCHUPSKY, J.J., RAFFA, R.B.,  
DODGSON, S.J., NORTEY, S.O., and MARYANOFF, B.E., *Epilepsia* 35 450-460,  
1994). Subsequent studies revealed that Compounds of Formula I were also highly

effective in the MES. test in rats. More recently topiramate was found to effectively block seizures in several rodent models of epilepsy (J. NAKAMURA, S. TAMURA, T. KANDA, A. ISHII, K. ISHIHARA, T. SERIKAWA, J. YAMADA, and M. SASA, Eur. J. Pharmacol. 254 83-89, 1994), and in an animal model of kindled epilepsy (A. WAUQUIER and S. ZHOU, Epilepsy Res. 24, 73-77, 1996).

Clinical studies on topiramate have revealed previously unrecognized pharmacological properties which suggest that topiramate will be effective in the reduction of blood glucose in animals, including but not limited to humans.

## 10 DISCLOSURE OF THE INVENTION

Accordingly, it has been found that compounds of the following formula I:

15

wherein X is O or CH<sub>2</sub>, and R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> are as defined hereinafter are useful in maintaining weight loss.

## DETAILED DESCRIPTION OF THE PREFERRED EMBODIEMENTS

20

The sulfamates of the invention are of the following formula (I):

wherein

25 X is CH<sub>2</sub> or oxygen;

R<sub>1</sub> is hydrogen or alkyl; and

R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> are independently hydrogen or alkyl and, when X is CH<sub>2</sub>, R<sub>4</sub> and R<sub>5</sub> may be alkene groups joined to form a benzene ring and, when X is oxygen, R<sub>2</sub> and R<sub>3</sub> and/or R<sub>4</sub> and R<sub>5</sub> together may be a methylenedioxy group of the following

5 formula (II):

wherein

R<sub>6</sub> and R<sub>7</sub> are the same or different and are hydrogen, lower alkyl or are alkyl and are  
10 joined to form a cyclopentyl or cyclohexyl ring.

R<sub>1</sub> in particular is hydrogen or alkyl of about 1 to 4 carbons, such as methyl, ethyl and iso-propyl. Alkyl throughout this specification includes straight and branched chain alkyl. Alkyl groups for R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub> and R<sub>7</sub> are of about 1 to 3 carbons and include methyl, ethyl, iso-propyl and n-propyl. When X is CH<sub>2</sub>, R<sub>4</sub> and R<sub>5</sub> may  
15 combine to form a benzene ring fused to the 6-membered X-containing ring, i.e., R<sub>4</sub> and R<sub>5</sub> are defined by the alkatrienyl group =C-CH=CH-CH=.

A particular group of compounds of formula (I) is that wherein X is oxygen and both R<sub>2</sub> and R<sub>3</sub> and R<sub>4</sub> and R<sub>5</sub> together are methylenedioxy groups of the formula (II), wherein R<sub>6</sub> and R<sub>7</sub> are both hydrogen both alkyl or combine to form a spiro  
20 cyclopentyl or cyclohexyl ring, in particular where R<sub>6</sub> and R<sub>7</sub> are both alkyl such as methyl. A second group of compounds is that wherein X is CH<sub>2</sub> and R<sub>4</sub> and R<sub>5</sub> are joined to form a benzene ring. A third group of compounds of formula (I) is that wherein both R<sub>2</sub> and R<sub>3</sub> are hydrogen.

The compounds of formula (I) may be synthesized by the following methods:

25 (a) Reaction of an alcohol of the formula RCH<sub>2</sub>OH with a chlorosulfamate of the formula ClSO<sub>2</sub>NH<sub>2</sub> or ClSO<sub>2</sub>NHR<sub>1</sub> in the presence of a base such as potassium a-butoxide or sodium hydride at a temperature of about -20° to 25° C and in a solvent

such as toluene, THF or dimethylformamide wherein R is a moiety of the following formula (III):

(b) Reaction of an alcohol of the formula  $RCH_2OH$  with sulfurylchloride of the  
 5 formula  $SO_2Cl_2$  in the presence of a base such as triethylamine or pyridine at a  
 temperature of about  $-40^\circ$  to  $25^\circ$  C in a solvent such as diethyl ether or methylene  
 chloride to produce a chlorosulfate of the formula  $RCH_2OSO_2Cl$ .

The chlorosulfate of the formula  $RCH_2OSO_2Cl$  may then be reacted with an  
 amine of the formula  $R_1NH_2$  at a temperature of about  $40^\circ$  to  $25^\circ$  C in a solvent such as  
 10 methylene chloride or acetonitrile to produce a compound of formula (I). The reaction  
 conditions for (b) are also described by T. Tsuchiya et al. in Tet. Letters, No. 36, p.  
 3365 to 3368 (1978).

(c) Reaction of the chlorosulfate  $RCH_2OSO_2Cl$  with a metal azide such as sodium  
 azide in a solvent such as methylene chloride or acetonitrile yields an azidosulfate of  
 15 the formula  $RCH_2OSO_2N_3$  as described by M. Hedayatullah in Tet. Lett. p. 2455-2458  
 (1975). The azidosulfate is then reduced to a compound of formula (I) wherein  $R_1$  is  
 hydrogen by catalytic hydrogenation, e.g. with a noble metal and  $H_2$  or by heating with  
 copper metal in a solvent such as methanol.

The starting materials of the formula  $RCH_2OH$  may be obtained commercially  
 20 or as known in the art. For example, starting materials of the formula  $RCH_2OH$   
 wherein both  $R_2$  and  $R_3$  and  $R_4$  and  $R_5$  are identical and are of the formula (II) may be  
 obtained by the method of R. F. Brady in Carbohydrate Research, Vol. 14, p. 35 to 40  
 (1970) or by reaction of the trimethylsilyl enol ether of a  $R_6COR_7$  ketone or aldehyde  
 with fructose at a temperature of about  $25^\circ$  C, in a solvent such a halocarbon, e.g.  
 25 methylene chloride in the presence of a protic acid such as hydrochloric acid or a Lewis  
 Acid such as zinc chloride. The trimethylsilyl enol ether reaction is described by G. L.  
 Larson et al in J. Org. Chem. Volaa 38, No. 22, p. 3935 (1973).

Further, carboxylic acids and aldehydes of the formulae  $RCOOH$  and  $RCHO$   
 may be reduced to compounds of the formula  $RCH_2OH$  by standard reduction  
 30 techniques, e.g. reaction with lithium aluminum hydride, sodium borohydride or

borane-THF complex in an inert solvent such a diglyme, THF or toluene at a temperature of about 0° to 100° C, e.g. as described by H.O. House in "Modern Synthetic Reactions", 2nd Ed., pages 45 to 144 (1972).

5 The compounds of formula I: may also be made by the process disclosed in 5,387,700, which is incorporated by reference herein.

The compounds of formula I include the various individual isomers as well as the racemates thereof, e.g., the various alpha and beta attachments, i.e., below and above the plane of the drawing, of R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> on the 6-membered ring. Preferably, the oxygene of the methylenedioxy group (II) are attached on the same side  
10 of the 6-membered ring.

In a retrospective analysis of the long term open-label studies in epilepsy in 1319 patients, treated with a mean daily dosage of 622 mg/day, for a mean duration of 689 days, 14 subjects were found to be overweight (defined as weight >100 kg) and with high blood glucose levels (>115 mg/dl). These patients had a 5.8% reduction in  
15 blood glucose during the period of treatment with topiramate.

For reducing glucose levels in the blood of mammals, a compound of formula (I) may be employed at a daily dose in the range of about 100 mg to 400 mg, usually in two daily divided doses, for an average adult human. A unit dose would contain about 15 to 200 mg of the active ingredient

20 To prepare the pharmaceutical compositions of this invention, one or more sulfamate compounds of formula (I) are intimately admixed with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques, which carrier may take a wide variety of forms depending on the form of preparation desired for administration, e.g., oral, by suppository, or parenteral. In preparing the  
25 compositions in oral dosage form, any of the usual pharmaceutical media may be employed. Thus, for liquid oral preparations, such as for example, suspensions, elixirs and solutions, suitable carriers and additives include water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents and the like; for solid oral preparations such as, for example, powders, capsules and tablets, suitable carriers and additives  
30 include starches, sugars, diluents, granulating agents, lubricants, binders, disintegrating agents and the like. Because of their ease in administration, tablets and capsules represent the most advantageous oral dosage unit form, in which case solid pharmaceutical carriers are obviously employed. If desired, tablets may be sugar coated

or enteric coated by standard techniques. Suppositories may be prepared, in which case cocoa butter could be used as the carrier. For parenterals, the carrier will usually comprise sterile water, though other ingredients, for example, for purposes such as aiding solubility or for preservation, may be included. Injectable solutions may also be prepared in which case appropriate stabilizing agents may be employed. Topiramate is currently available for oral administration in round tablets containing 25 mg, 100 mg or 200 mg of active agent. The tablets contain the following inactive ingredients: lactose hydrous, pregelatinized starch, microcrystalline cellulose, sodium starch glycolate, magnesium stearate, purified water, carnauba wax, hydroxypropyl methylcellulose, titanium dioxide, polyethylene glycol, synthetic iron oxide, and polysorbate 80.

The pharmaceutical compositions herein will contain, per dosage unit, e.g., tablet, capsule, powder injection, teaspoonful, suppository and the like from about 25 to about 200 mg of the active ingredient.

**WHAT IS CLAIMED IS:**

1. A method for reducing blood glucose levels in a mammal comprising administering  
 5 to such a mammal a therapeutically effective amount for treating such condition of a compound of the formula I:

wherein

X is CH<sub>2</sub> or oxygen;

- 10 R<sub>1</sub> is hydrogen or alkyl; and

R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> are independently hydrogen or alkyl and, when X is CH<sub>2</sub>, R<sub>4</sub> and R<sub>5</sub> may be alkene groups joined to form a benzene ring and, when X is oxygen, R<sub>2</sub> and R<sub>3</sub> and/or R<sub>4</sub> and R<sub>5</sub> together may be a methylenedioxy group of the following formula (II):

15

wherein

- 20 R<sub>6</sub> and R<sub>7</sub> are the same or different and are hydrogen, or alkyl and are joined to form a cyclopentyl or cyclohexyl ring.

2. The method of claim 1 wherein the compound of formula I is topiramate.  
 3. The method of claim 1, wherein the therapeutically effective amount is of from about 100 to 400 mg.
